

# CREPOSIDONIA

## Posidonia meadows in Spetses

*Posidonia oceanica* is a marine phanerogam plant that forms meadows and is endemic to the Mediterranean!

It produces  $O_2$  & sequesters  $CO_2$  in its rhizomes for centuries, helping in the mitigation of the Climate Crisis!

It is a biodiversity hotspot, hosting >500 species of fish and other marine organisms!

The damage that anchors and their chains invoke to Posidonia meadows is irreversible.

**Do not anchor on Posidonia meadows!**

The meadows it forms protect our sandy beaches from erosion!

**Choose to anchor on sandy bottoms for better grasp whilst protecting this precious habitat!**
